NGI/SciLifeLab, Uppsala Node

# Outline

- INTRO: Sequencing service at NGI-SciLifeLab
- NGS general knowledge: current technologies
- NGS Challenges:
  - Sequencing artefacts
  - NGS sample quality requirements
- Next global challenge: the Earth Biogenome Project

# upen to all Swedish academic sciendoknowledge Consultation and introducts by allow protoco Workshops, cours not basis have technologies. Tost basis have technologies. res at NGI helpby Scilifer We Wand 1

- Emphasis on data gun Q and needs of the users.

  Illuminant excing and genotypic by SWEVAC 150 177

### Quality

- lon and PacBio: accreditation due 517

### **NGI Support**

### **Pre-sequencing**

- Project design via discussions with users
- •Advise in sample collection and preparation
- Case-to-case DNA extraction service

### **Post-sequencing:**

- Control over produced data: making sure data meet our high standards in terms of quality and yield.
- Primary analysis of human genomes is enabled
- Genome assembly of PacBio data is offered as a service
- Data is delivered to UPPMAX (Uppsala Multidisciplinary Center for Advanced Computational Science)

**Collaborative projects** for technology and method development

### **Education**

# **Current Technologies**

### Current leader on the NGS market

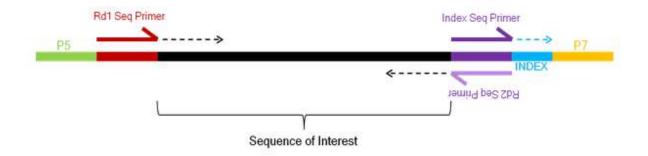

Instrument	Run time	Max output	Max reads/run	Max read length
iSeq	9.5 – 19 hrs	1.2 Gb	4 mln	PE 150
MiniSeq	4-24 hrs	7.5 Gb	25 mln	PE 150
MiSeq	4-55 hours	15 Gb	25 mln	PE 300
NextSeq series	12-48 hours	120-300 Gb	0.4 – 1 bln	PE 150
NovaSeq 6000	13-44 hours	6 Tb	20 bln	PE 250

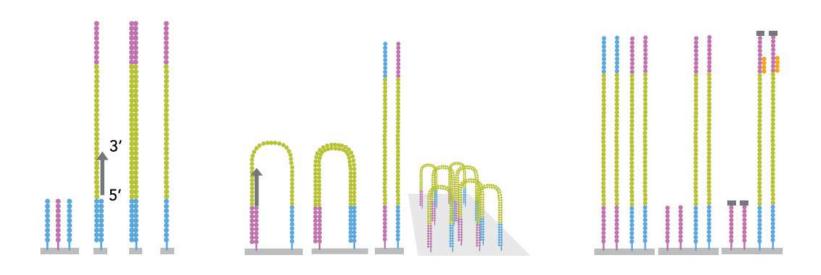

RIP: HiSeq 2500 & HiSeq X

Used for everything

# Illumina: bridge amplification

### Ion S5 XL

Chip:	Run time	Output	Max reads/ run	Max read length
510	2.5-4 hrs	0.3 - 0.5 Gb	2-3 mln	SE 400 bp
520	2.5-4 hrs	0.6-2 Gb	3-6 mln	SE 600 bp
530	2.5-4 hrs	3-8 Gb	15-20 mln	SE 600 bp
540	2.5-4 hrs	10-15 Gb	60-80 mln	SE 400 bp

# Other technologies & methods

New Sequencing technology coming to NGI for *evaluation*:

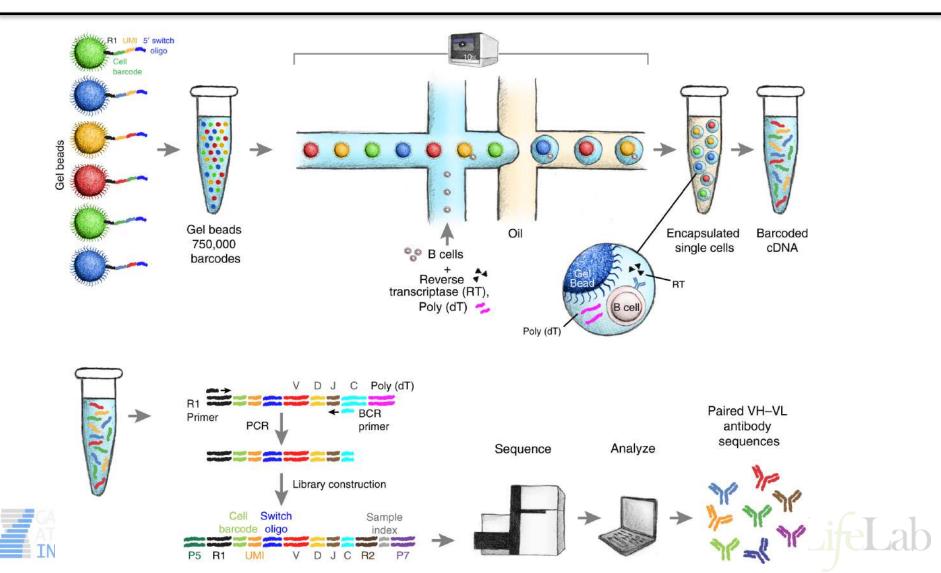

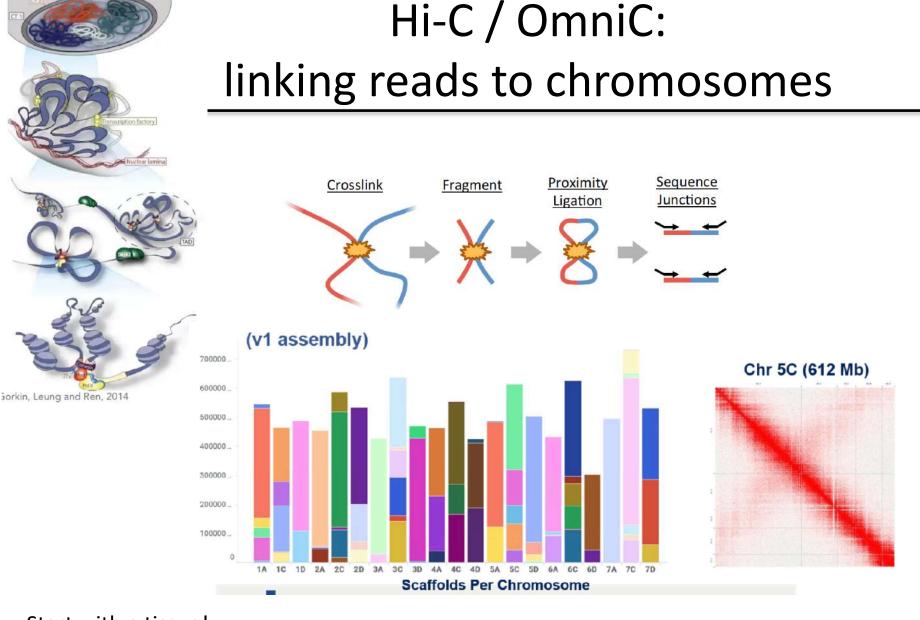

Output similar to Illumina

# 10x Genomics (Chromium)

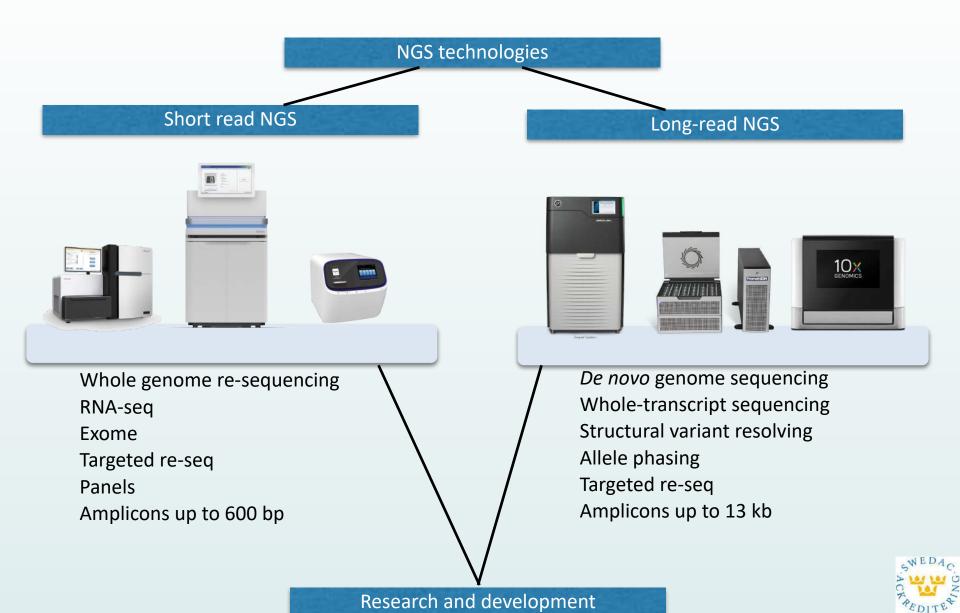

Start with a tissue!

Capture DNA bound to the same nucleosome

Make a library and sequence on Illumina NovaSeq

## **Technologies and Applications at NGI**

# **NGS Technologies: SUMMARY**

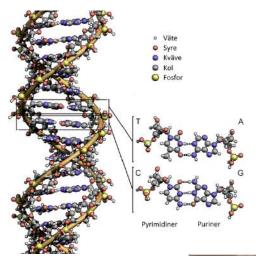

- Development goes VERY FAST
- All technologies have their PROs and CONs
- One technology does not suit all the applications
- In some projects, several technologies should be combined

# Making sense of genomics data:

Understanding sequencing bias

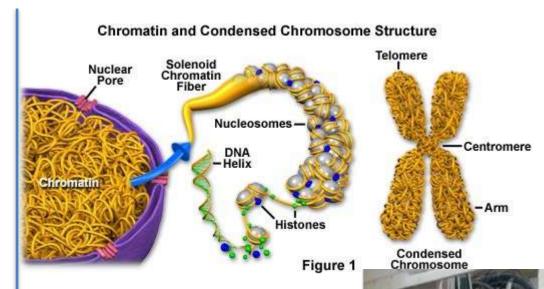

Sequencing a representative, completely randomized subsample:

it starts with input material

What textbook tells you

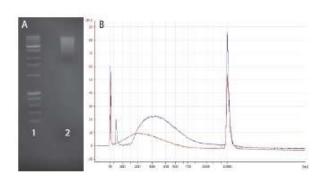

Brutal reality

Do not forget:

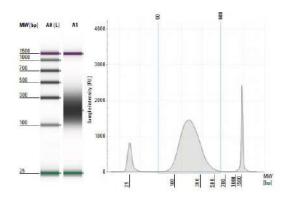

DNA in solution behaves differently

Sequencing a representative, completely randomized subsample:

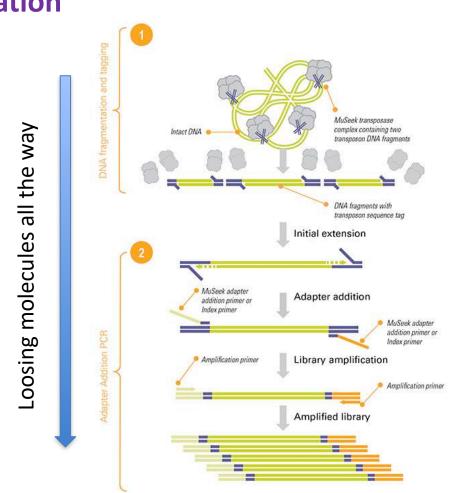

continues with library preparation

Input sample

Shearing and size-selection

Less material -> more amplification cycles

### PCR bias – important source of sequencing artefacts

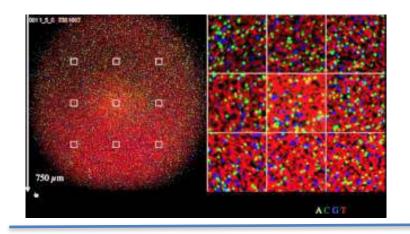

### PCR steps involved in any NGS but PacBio and Oxford Nanopore:

- 1. Library amplification
- Amplification during templating (Illumina on glass; Ion emPCR)

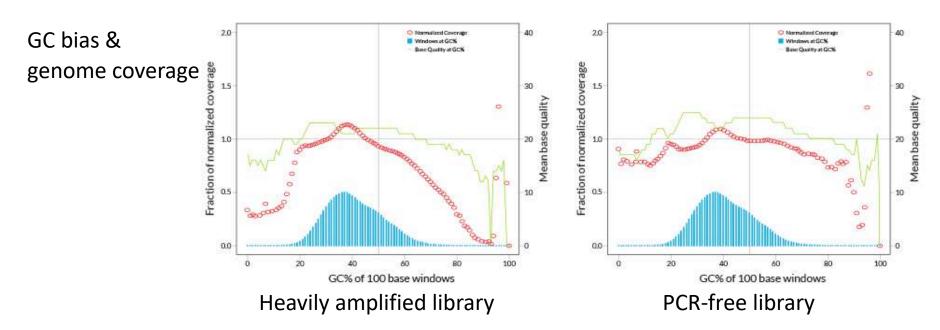

### **Main PCR bias:**

- 1. Size: shorter fragments amplify faster -> higher sequencing signal and coverage
- 2. Polymerase errors
  - slippage in low complexity regions incorporation of erroneous bases & indels
- 3. GC-bias (fragments with high GC diminish to 1/10th from initial amount)

**PCR** bias – important source of sequencing artefacts

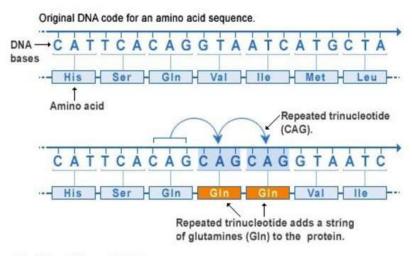

Clusters with shorter fragments grow faster -> quality signal from smaller clusters worsens

### **PCR** bias – important source of sequencing artefacts

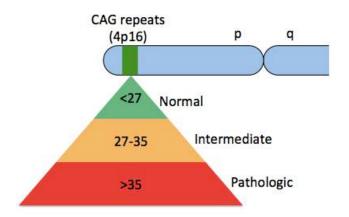

Polymerase slippage – low complexity regions

### Repeat expansion mutation

U.S. National Library of Medicine

### Huntington's Disease

### **Huntington's disease:**

- Inherited disorder resulting in brain cell death
- Decline of motoric and cognitive functions
- Common onset: 30-50 years of age
- No cure
- Causative genetic variant: CAG-repeat expansion in HTT gene

# **Sequencing bias: SUMMARY**

- Keep in mind that they are there
- Coverage varies across the genome
- One technology does not suit all the applications

# **BREAK**

# SAMPLE QUALITY REQUIREMENTS

# Garbage in – garbage out:

Sequencing success always depends on the sample quality.

NGS-quality DNA and PCR-quality DNA are two completely different things.

a. Extraction with Strong Salt Solution, Deproteinization with Chloroform

(1) Sodium Deoxyribonucleate of Calf Thymus. 98 Fresh frozen calf thymus glands (54.5 kg.) were minced and suspended in 0.9% sodium chloride (54.1.) and milled to produce a fine suspension. This suspension was centrifuged (0500 r.p.m.) and the solid material resuspended in 0.9% sodium chloride (45.5 l.) and milled and centrifuged as before. The tissues, which were now free of material containing pentose, were suspended in 10% sodium chloride (214 l.) with vigorous mechanical stirring at 0°. At

this stage the viscosity of the solution increased considerably. After extraction at 0° for 48 hours, the insoluble material was removed by centrifuging (6300 r.p.m.) and the deoxypentose nucleoprotein precipitated from the resultant solution (pH 6.5) by the addition of an equal volume of industrial methanol. The precipitated solid was washed with 79%, then 199% industrial methanol and dried in a vacuum at room temperature. Yield, 1.69 kg. of a very slightly yellow fibrous solid.

A general method for isolation of high molecular weight DNA from eukaryotes

# THE PREPARATION OF DEOXYRIBONUCLEIC ACIDS BY THE ρ-AMINOSALICYLATE-PHENOL METHOD

Received 24 June 1976

### ABSTRACT

A new method for isolation of high molecular weight DNA from eukaryotes is presented. This procedure allows preparation of DNA from a variety of tissues such as calf thymus or human placenta and from cells which were more difficult to lyse until now (e.g. Crypthecodinium cuhnii, a dinoflagellate). The DNA obtained in such a way has an average molecular weight of about 200 x  $10^6$  d and contains very few, if any, single strand breaks.

INTRODUCTION

Isolation of large quantities of nick-free, high molecular weight DNA from eukaryotic organisms has heretofore presented considerable technical difficulties. DNA prepared by conventional techniques has been a heterogeneous population of molecules ranging in molecular weight from 10 x 10°

to  $20 \times 10^6$  d (1, 2). The single strand molecular weight was often around

For Long Reads one needs to have long and pure DNA

# DNA quality and inhibition of sequencing

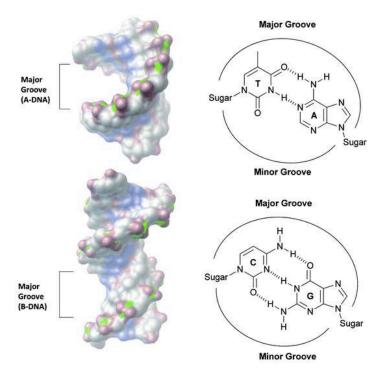

Short-read technologies: PCR inhibition Long-read technologies are PCR-free, but one sequences native DNA "as is".

#### **DNA-binders:**

- Proteins
- Polyphenols
- Secondary metabolites (e.g. toxins)
- Pigments
- Polysaccharides

### Polymerase inhibitors:

- Salts
- Phenol
- Alcohols

Hamilton & Arya, Nat. Prod. Rep., 2012, 29, 134-143

Physical inhibiting factors – debris

# What do absorption ratios tell us?

### Pure DNA <u>260</u>/280: 1.8 – 2.0

#### < 1.8:

Too little DNA compared to other components of the solution; presence of organic contaminants: proteins and phenol; glycogen - absorb at 280 nm.

#### > 2.0:

High share of RNA.

### Pure DNA <u>260</u>/230: 2.0 – 2.2

#### <2.0:

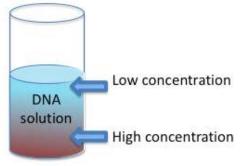

Salt contamination, humic acids, peptides, aromatic compounds, polyphenols, urea, guanidine, thiocyanates (latter three are common kit components) – absorb at 230 nm.

#### **>2.2**:

High share of RNA, very high share of phenol, **high turbidity**, dirty instrument, wrong blank.

Photometrically active contaminants: phenol, polyphenols, EDTA, thiocyanate, protein, RNA, nucleotides (fragments below 5 bp)

# How to make a correct DNA measurement

LMW-DNA

HMW-DNA

- Thaw DNA completely
- Mix gently (never vortex!)
- Put the sample on a thermoblock: 37°C, 15-30 min
- Mix gently
- Dilute 1:100 (if HMW)
- Mix gently
- Make a measurement with an appropriate blank
- NANODROP is Bad. Point.
- Use Qubit, or PicoGreen.

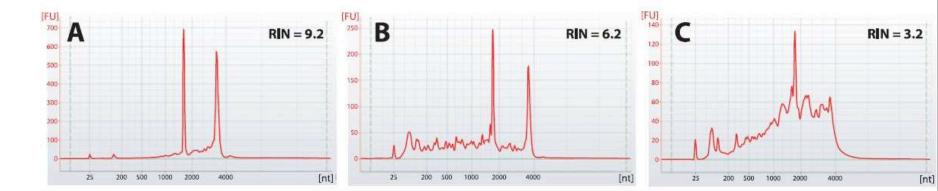

# Sample prep: RNA

### mRNA degrades FAST

Freeze sample or place it in RNA-later within 30 sec (if possible)

Chose a correct kit for your particular application! Always treat samples with DNase

Differential expression, miRNA – RIN value over 8.0 Aim for 4 biological replicates

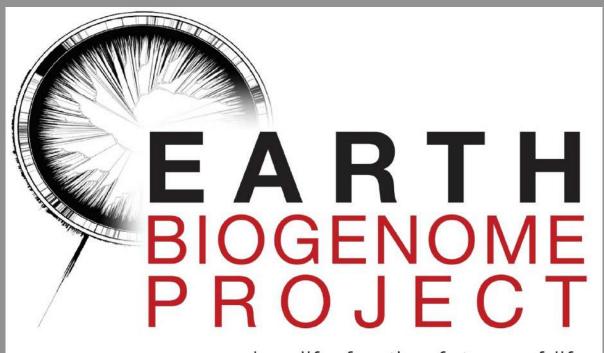

### Sample prep: SUMMARY

- Sequencing success depends on the sample quality, DNA or RNA
- DNA quality is essential for PacBio and ONT sequencing
   ... as well as PCR-free Illumina libraries & linked reads!

# NGS and its challenges: SUMMARY

- Technologies develop VERY FAST.
- Beware of sequencing bias.
- Sequencing result depends on sample quality.
- Consult experts when it comes to experimental design and technology choice.

sequencing life for the future of life

We choose to go to the moon in this decade and do the other things, not because they are easy, but because they are hard, because that goal will serve to organize and measure the best of our energies and skills.
