

Variant-calling Workflow

Markus Mayrhofer

What is a workflow

Overview

Today:

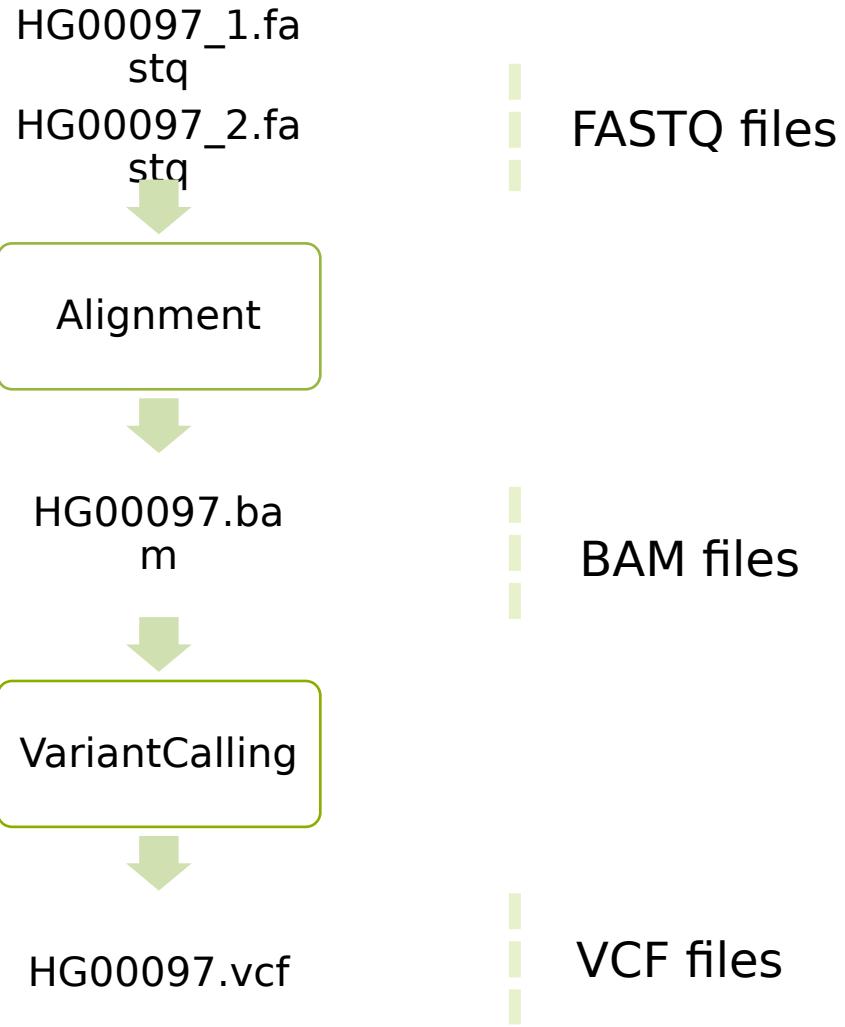

- Basic variant calling workflow for one sample
- Extend to multiple samples

Tomorrow:

- GATK's Best practices

Example: Basic workflow, one sample

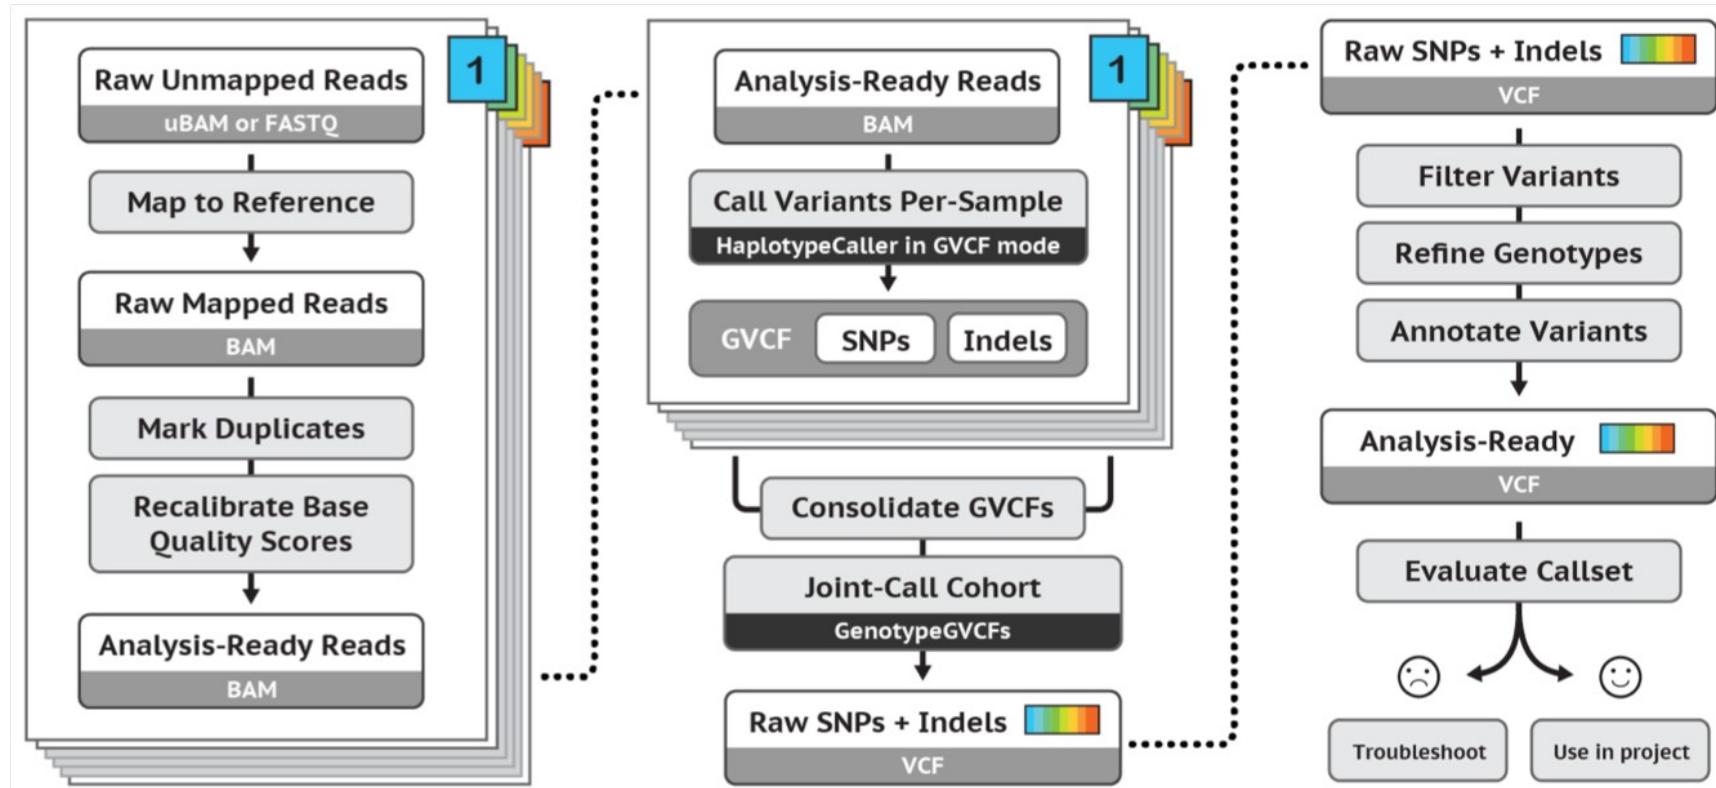

Workflow conventions

1. Create a new output file in each process
2. Don't overwrite the input file
3. Use informative file names
4. Include information of the process + sample
5. Correct name extension e.g. .bam, .vcf, ...

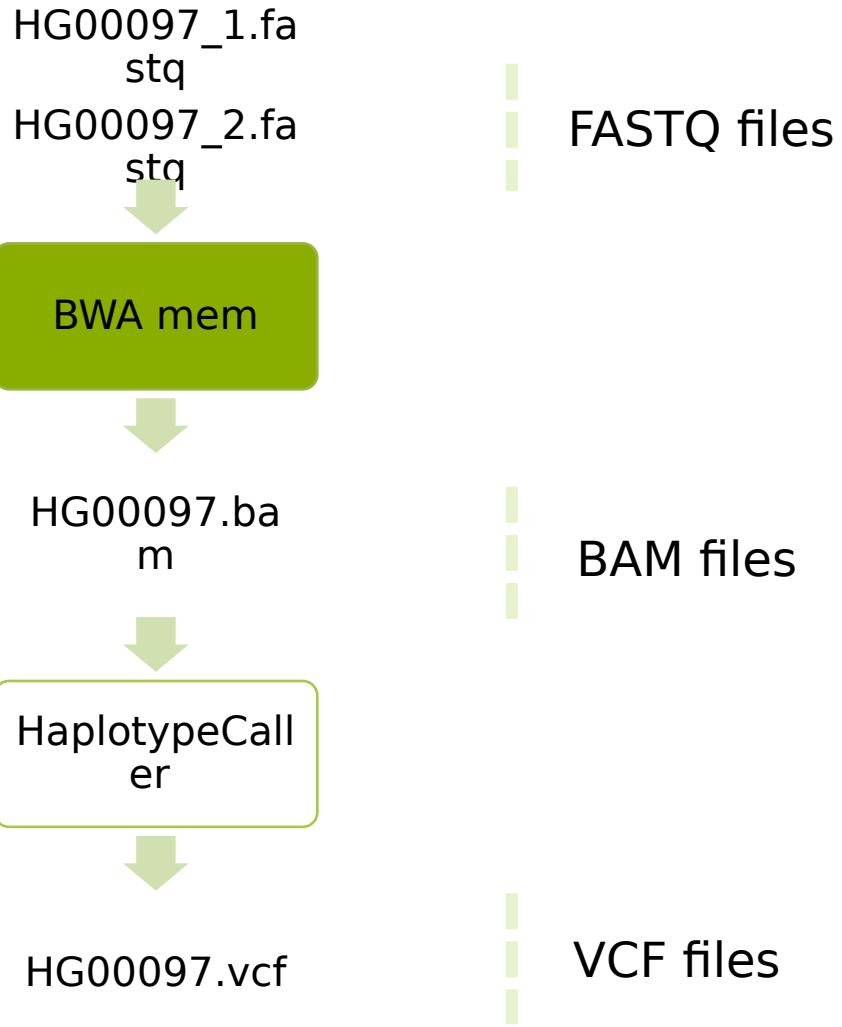

GATK's best practices workflow for germline short variant discovery

<https://software.broadinstitute.org/gatk/best-practices/>

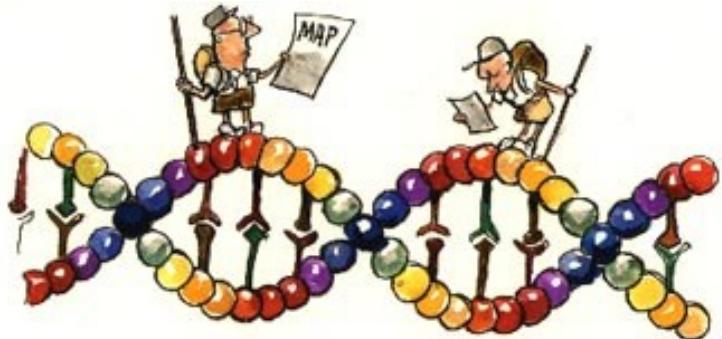

Basic Variant Calling in one sample

Alignment

The reference genome

A reference genome is a haploid nucleic acid sequence which represents a species genome.

The first draft of the human genome contained 150,000 gaps.

GRCh37: 250 gaps

We will work with GRCh37 in the lab.

Keep track of the reference version!

The reference genome sequence is used as input in many bioinformatics applications for NGS data:

- mapping
- variant calling
- annotation

You must keep track of which version of the reference genome your data was mapped to.

The same version must be used in all downstream analyses.

Burrows-Wheeler Aligner

Home

<p>Introduction</p> <p>BWA is a software package for mapping low-divergent sequences against a large reference genome, such as the human genome. It consists of three algorithms: BWA-backtrack, BWA-SW and BWA-MEM. The first algorithm is designed for Illumina sequence reads up to 100bp, while the rest two for longer sequences ranging from 70bp to 1Mbp. BWA-MEM and BWA-SW share similar features such as long-read support and split alignment, but BWA-MEM, which is the default, is generally recommended for high-quality queries as it is faster and more accurate. BWA-MEM also has better performance than BWA-backtrack for 70bp and longer reads.</p> <p>FAQ</p> <p>How can I cite BWA?</p> <p>The short read alignment component (bwa-short) has been published: Li H. and Durbin R. (2009) Fast and accurate short read alignment using the Burrows-Wheeler Transform. Bioinformatics, 25:1754–60. [PMID: 19451168]</p> <p>If you use BWA-SW, please cite:</p> <p>Li H. and Durbin R. (2010) Fast and accurate long-read alignment using the Burrows-Wheeler Transform. Bioinformatics, Epub. [PMID: 20536111]</p> <p>(See also Errata below for a minor correction to the formulae in the published papers.)</p> <p>There are three algorithms, which one should I choose?</p> <p>For 70bp or longer Illumina, 454, Ion Torrent and Sanger reads, contigs and BAC sequences, BWA-MEM is usually the preferred algorithm. For short sequences, BWA-backtrack may be better. BWA-SW may be better for 70bp reads.</p>	<p>BWA:</p> <p>SF project page</p> <p>Burrows-Wheeler transform of reference genome</p> <div style="border: 1px solid black; padding: 10px; margin-bottom: 10px;"> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr><td>0</td><td>googol\$</td><td>0</td><td>\$googo l</td></tr> <tr><td>1</td><td>oogol\$g</td><td>1</td><td>gol\$go o</td></tr> <tr><td>2</td><td>ogol\$go</td><td>2</td><td>0 googol \$</td></tr> <tr><td>3</td><td>gol\$goo</td><td>3</td><td>l\$goog o</td></tr> <tr><td>4</td><td>ol\$goog</td><td>4</td><td>ogol\$g o</td></tr> <tr><td>5</td><td>l\$googo</td><td>5</td><td>ol\$goo g</td></tr> <tr><td>6</td><td>\$googol</td><td>6</td><td>oogol\$ g</td></tr> </table> <p style="text-align: center;">String Sorting →</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr><td>0</td><td>6</td><td>\$googo l</td></tr> <tr><td>1</td><td>3</td><td>gol\$go o</td></tr> <tr><td>2</td><td>0</td><td>0 googol \$</td></tr> <tr><td>3</td><td>5</td><td>l\$goog o</td></tr> <tr><td>4</td><td>2</td><td>ogol\$g o</td></tr> <tr><td>5</td><td>4</td><td>ol\$goo g</td></tr> <tr><td>6</td><td>1</td><td>oogol\$ g</td></tr> </table> </div> <div style="display: flex; align-items: center;"> <p>Pos</p> <p style="margin: 0 10px;">i</p> <p style="margin: 0 10px;">S(i)</p> <p style="margin: 0 10px;">B[i]</p> <p style="margin-left: 10px;">↓</p> <p>X = googol\$</p> <p style="margin-left: 10px;">↓</p> <p>lo\$oogg</p> <p style="margin-left: 10px;">↓</p> <p>(6, 3, 0, 5, 2, 4, 1)</p> </div>	0	googol\$	0	\$googo l	1	oogol\$g	1	gol\$go o	2	ogol\$go	2	0 googol \$	3	gol\$goo	3	l\$goog o	4	ol\$goog	4	ogol\$g o	5	l\$googo	5	ol\$goo g	6	\$googol	6	oogol\$ g	0	6	\$googo l	1	3	gol\$go o	2	0	0 googol \$	3	5	l\$goog o	4	2	ogol\$g o	5	4	ol\$goo g	6	1	oogol\$ g

 Reference sequence name

Sequence
 Quality

Convert to Bam

Bam file is a binary representation of the Sam file

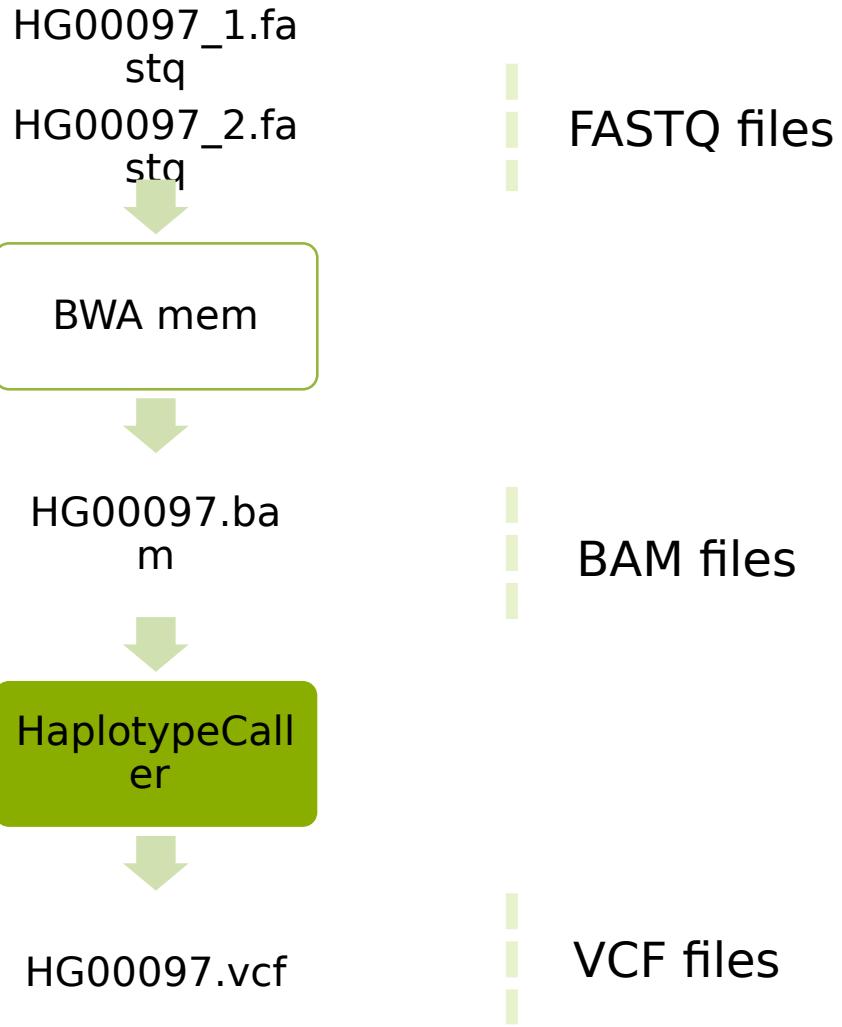

File indices

- Most large files we work with, such as the reference genome (**.fasta**) and the aligned reads (**.bam**) need an index
- The index is a small file
- Allows efficient access to the large file
- Different indices for different file types
- BWA index = Burrows-Wheeler transform of reference genome
(several files)

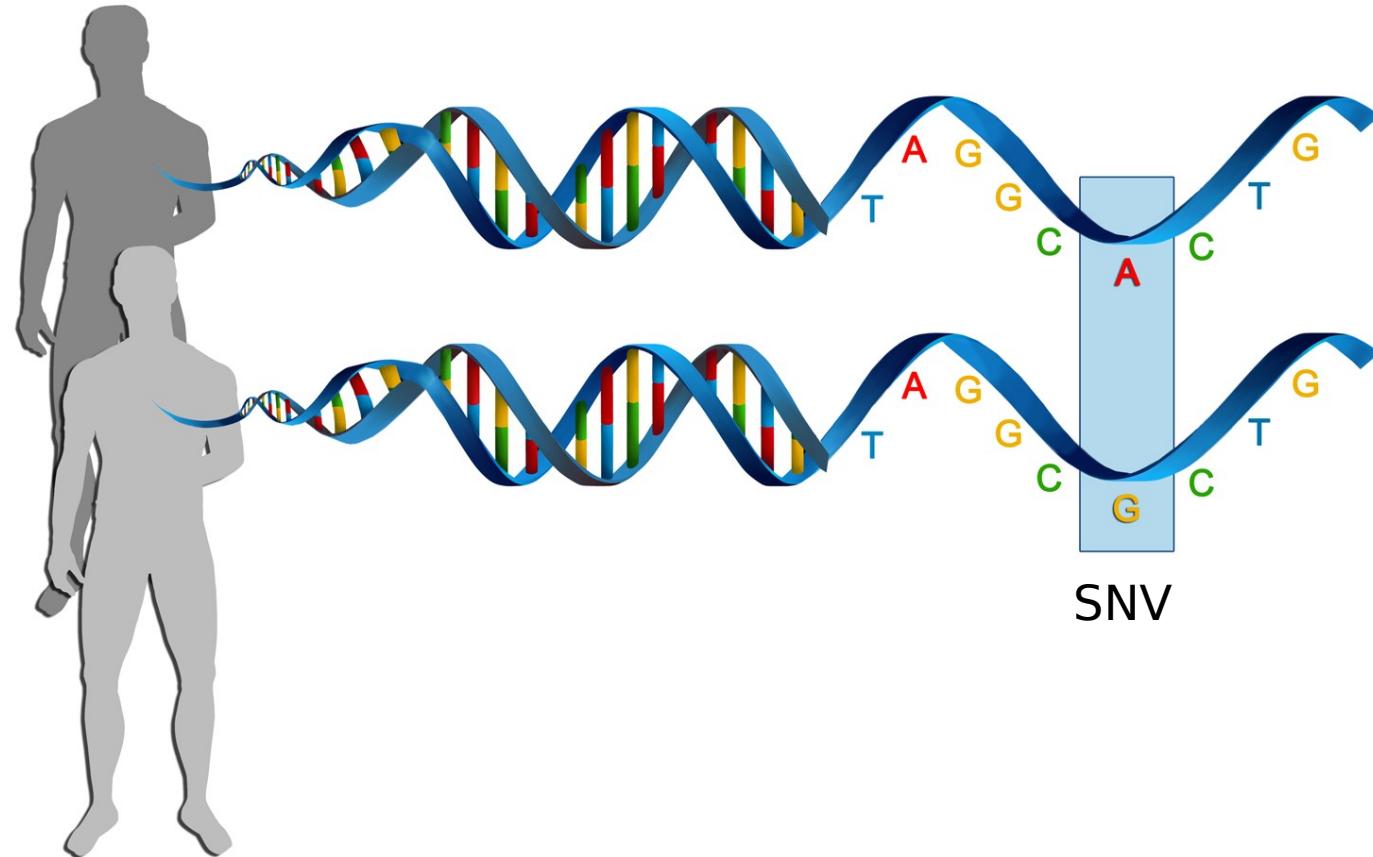

Variant calling

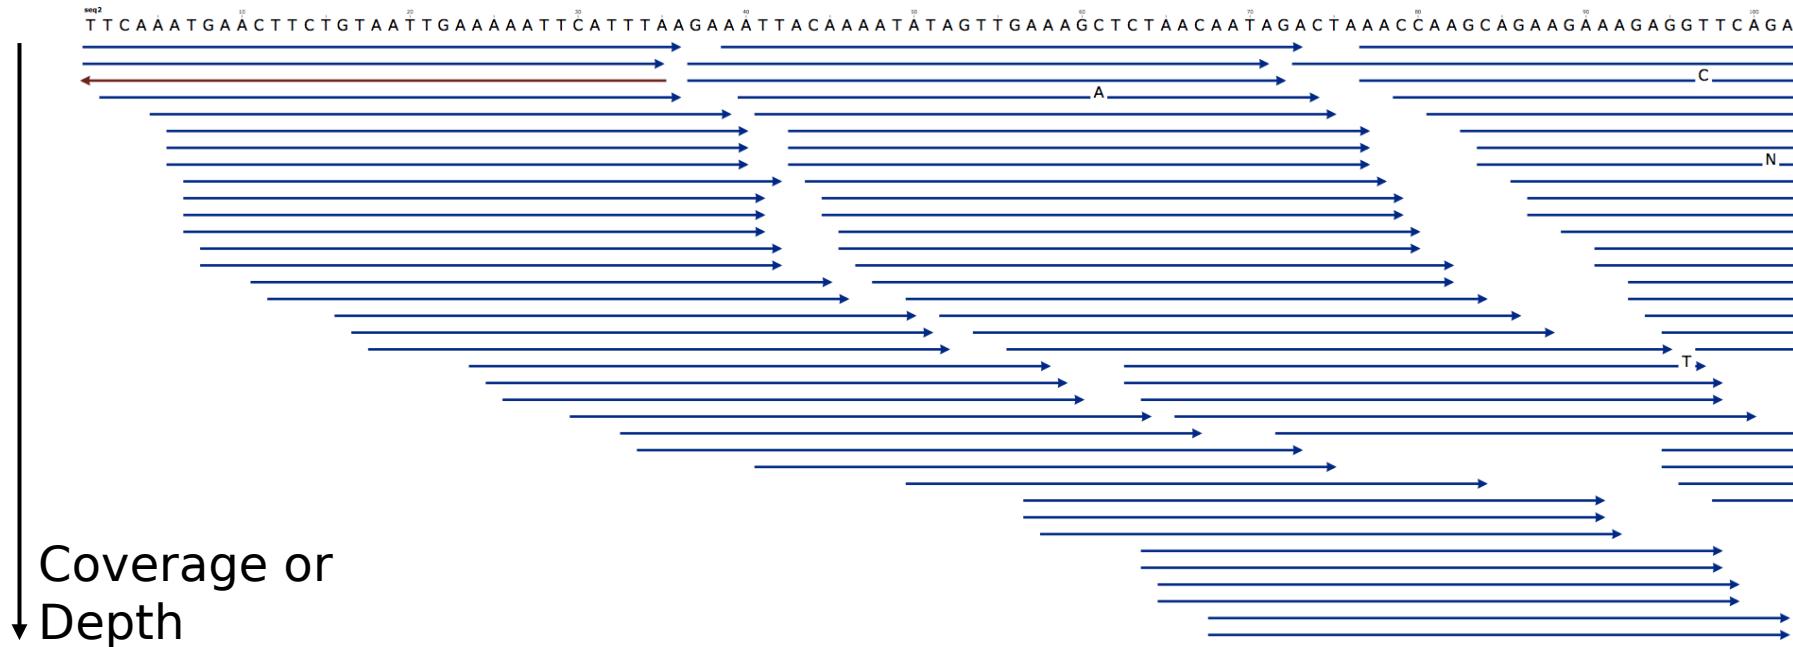

Genetic variation

Genetic variation = differences in DNA among individuals of the same species

Alignment

Detecting variants in reads

Basic variant calling in cohort

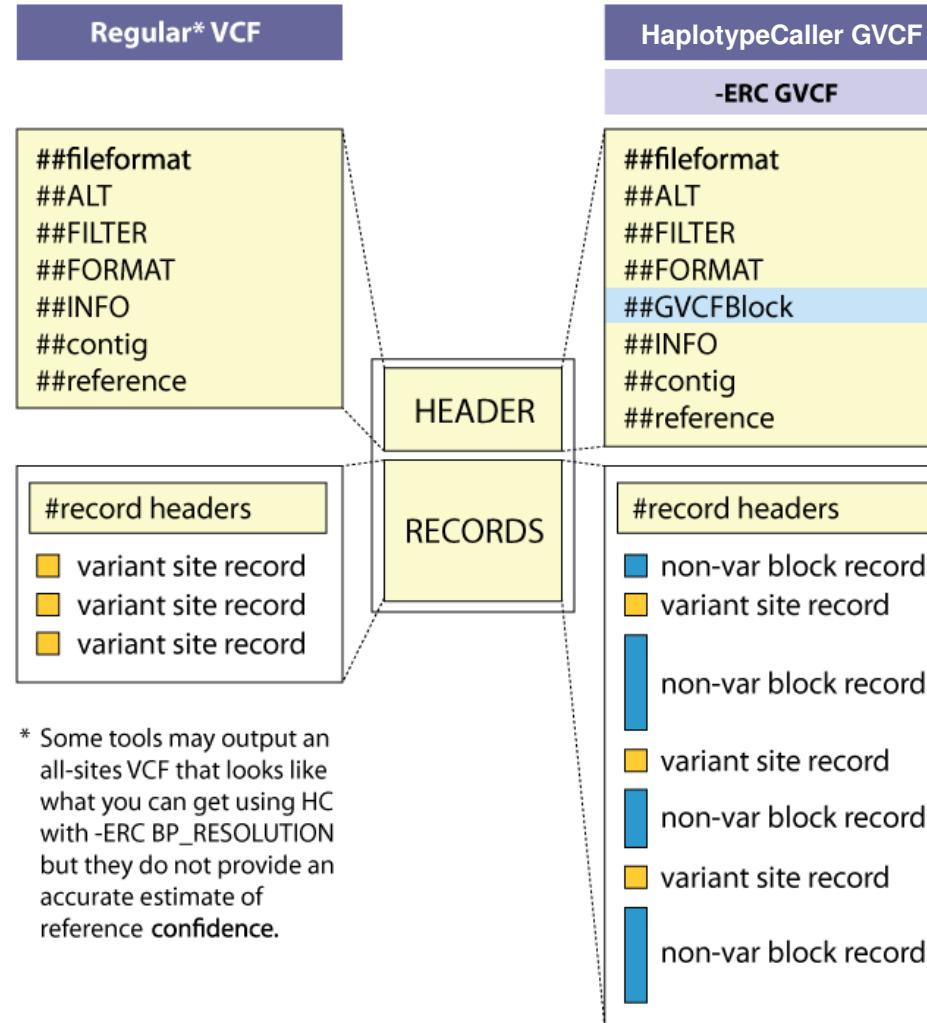

Basic variant calling in cohort

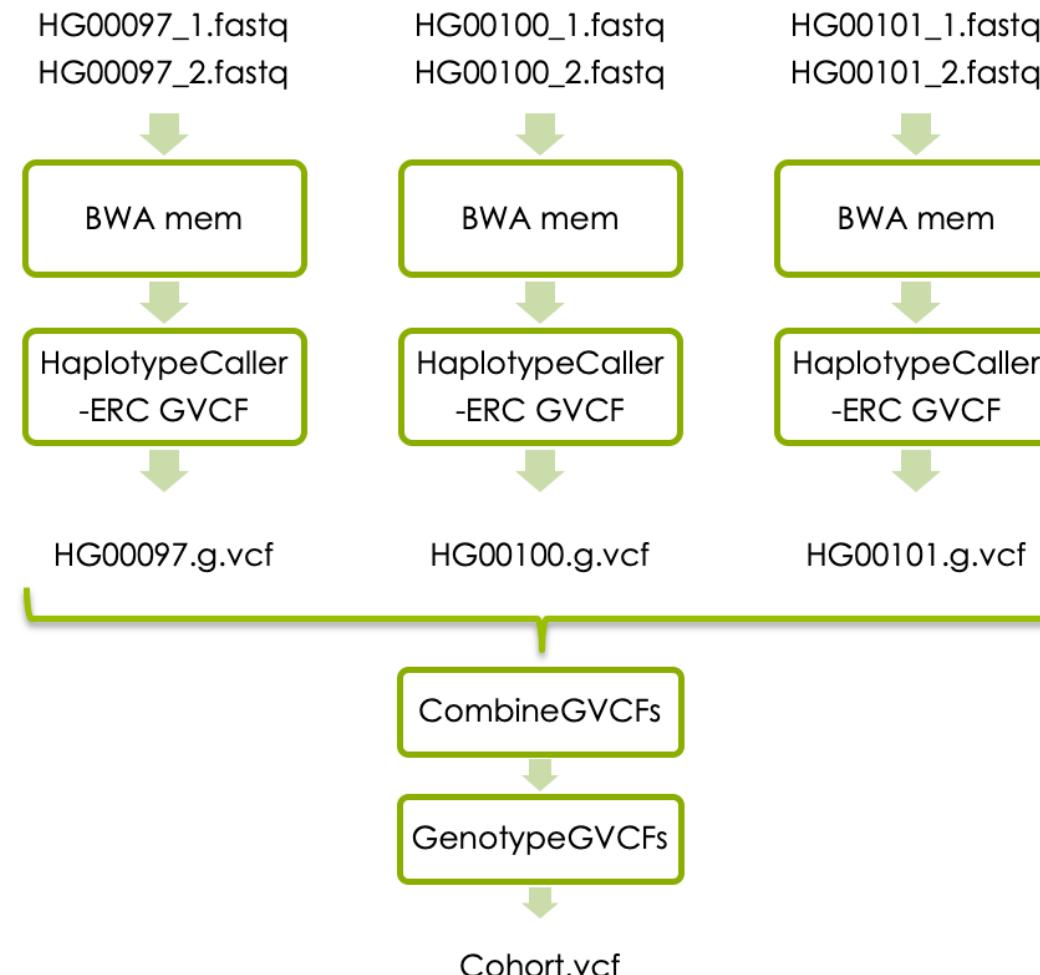

GVCF Files are valid VCFs with extra information

- GVCF has records for all sites, whether there is a variant call there or not.
- The records include an accurate estimation of how confident we are in the determination that the sites are homozygous-reference or not.
- Adjacent non-variant sites merged into blocks

Basic variant calling in cohort

Today's lab

1000 Genomes data

- Low coverage WGS data
- 3 samples
- Small region on chromosome 2

About the samples:
<https://www.internationalgenome.org/data-portal/sample>

The Lactase enzyme

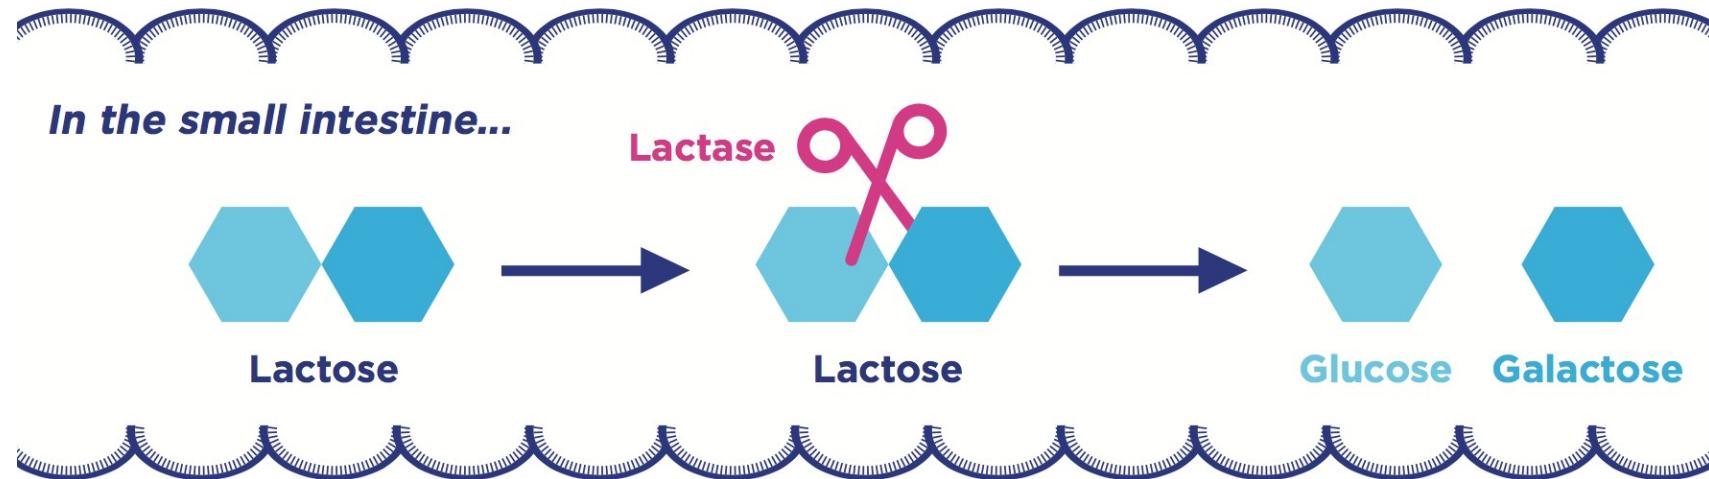

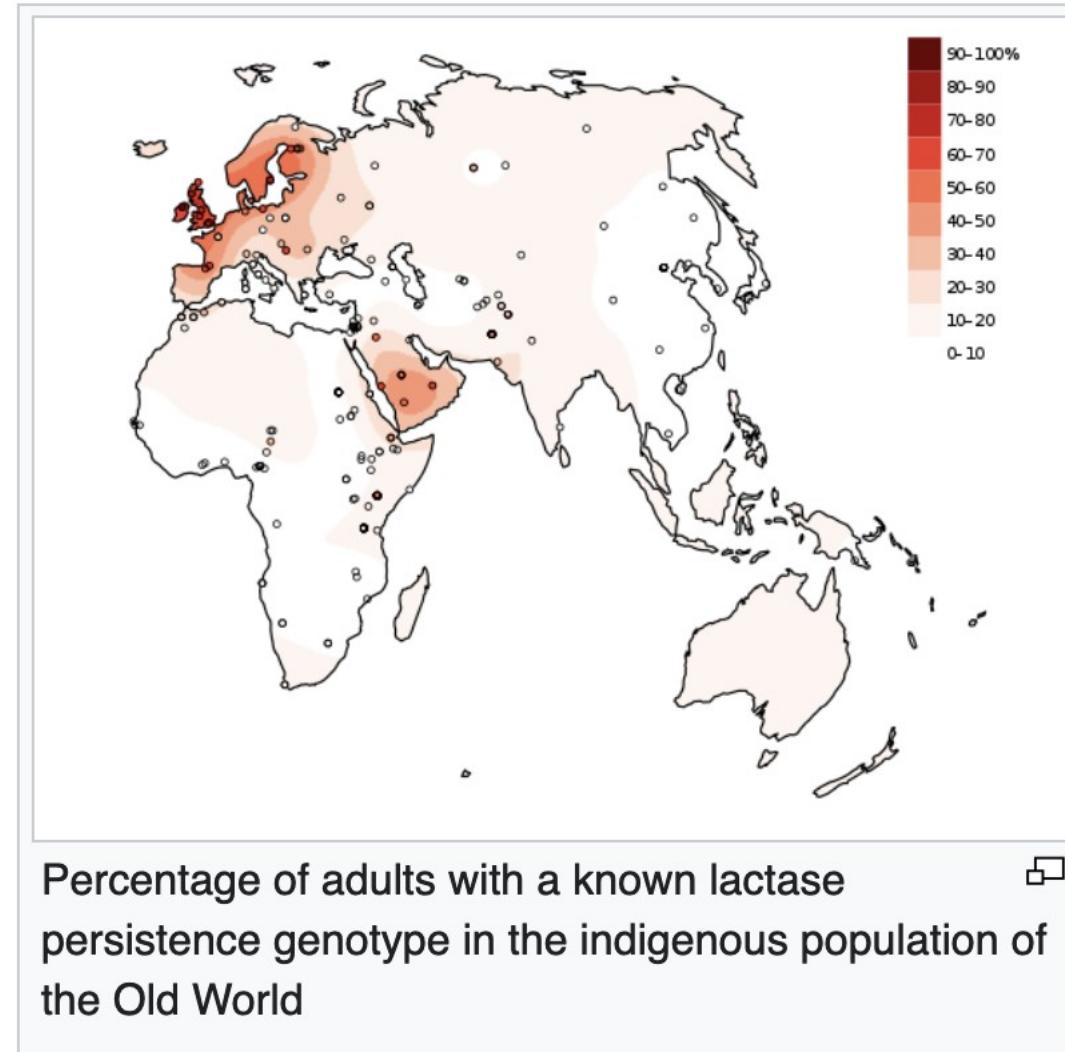

Figure 2. Lactose digestion in the intestine.

- All mammals produce lactase as infants
- Some humans produce lactase in adulthood
- Genetic variation upstream of the *LCT* gene causes the lactase persistent phenotype (lactose tolerance)

The Lactase enzyme

Mark Duplicates

Duplicate reads

- PCR duplicates - library preparation
- Optical duplicates - sequencing
- Don't add unique information
- Gives false allelic ratios of variants
- Should be removed/marked

MarkDuplicates

[GATK](#) / [Tool Index](#) / 4.0.1.1

MarkDuplicates (Picard)

[Follow](#)

GATK Team

10 months ago · Updated

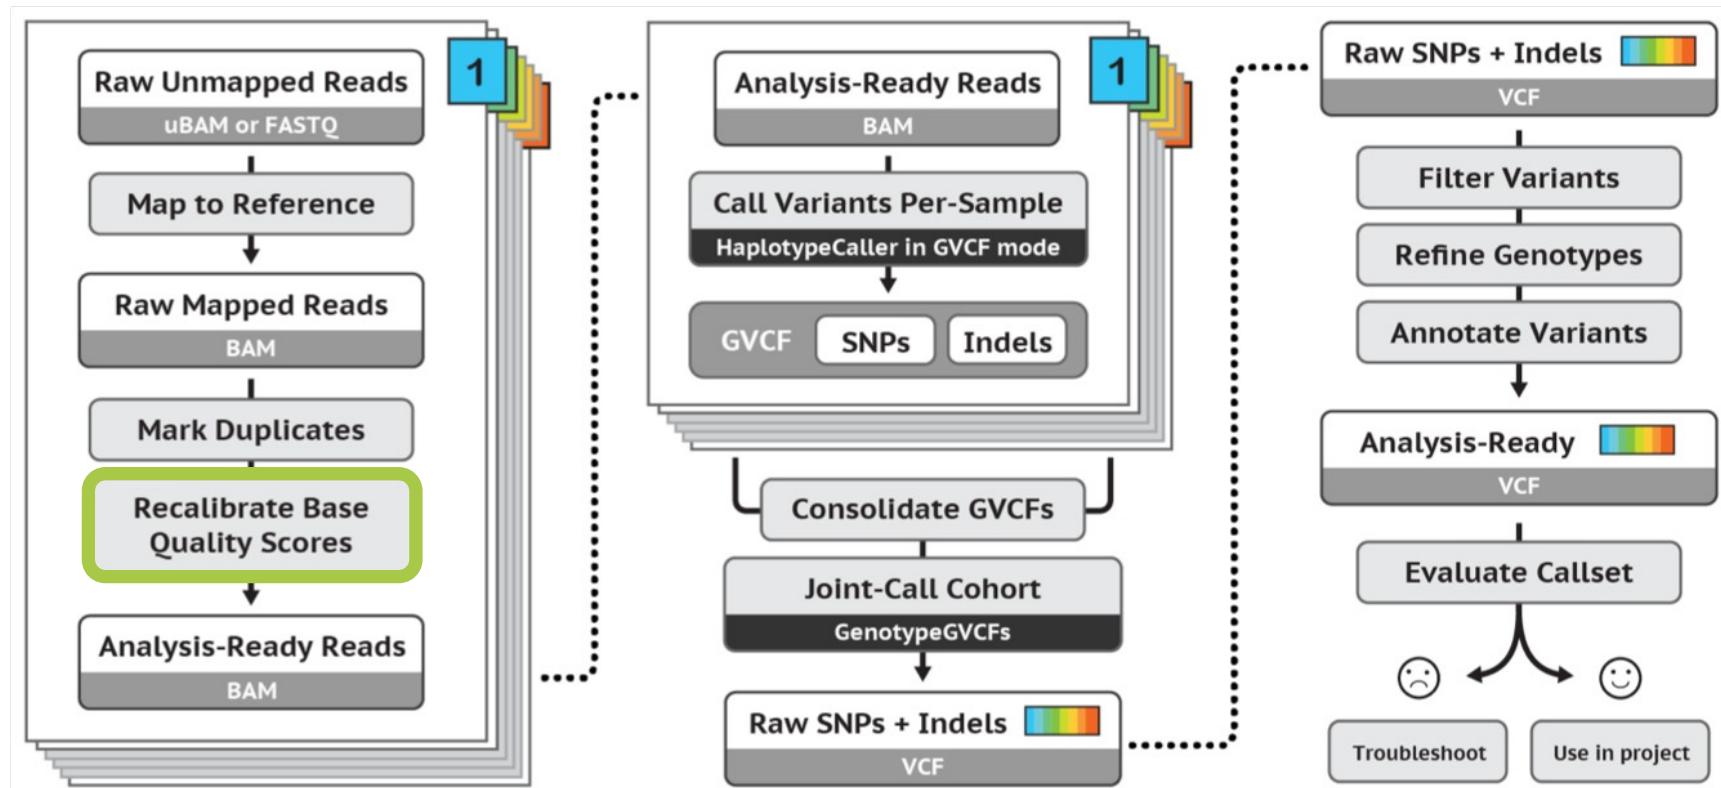

Identifies duplicate reads.

This tool locates and tags duplicate reads in a BAM or SAM file, where duplicate reads are defined as originating from a single fragment of DNA. Duplicates can arise during sample preparation e.g. library construction using PCR. See also [EstimateLibraryComplexity](#) for additional notes on PCR duplication artifacts. Duplicate reads can also result from a single amplification cluster, incorrectly detected as multiple clusters by the optical sensor of the sequencing instrument. These duplication artifacts are referred to as optical duplicates.

```
gatk --java-options -Xmx7g MarkDuplicates \
    -I input.bam \
    -O marked_duplicates.bam \
    -M marked_dup_metrics.txt
```

Base Quality Score Recalibration (BQSR)

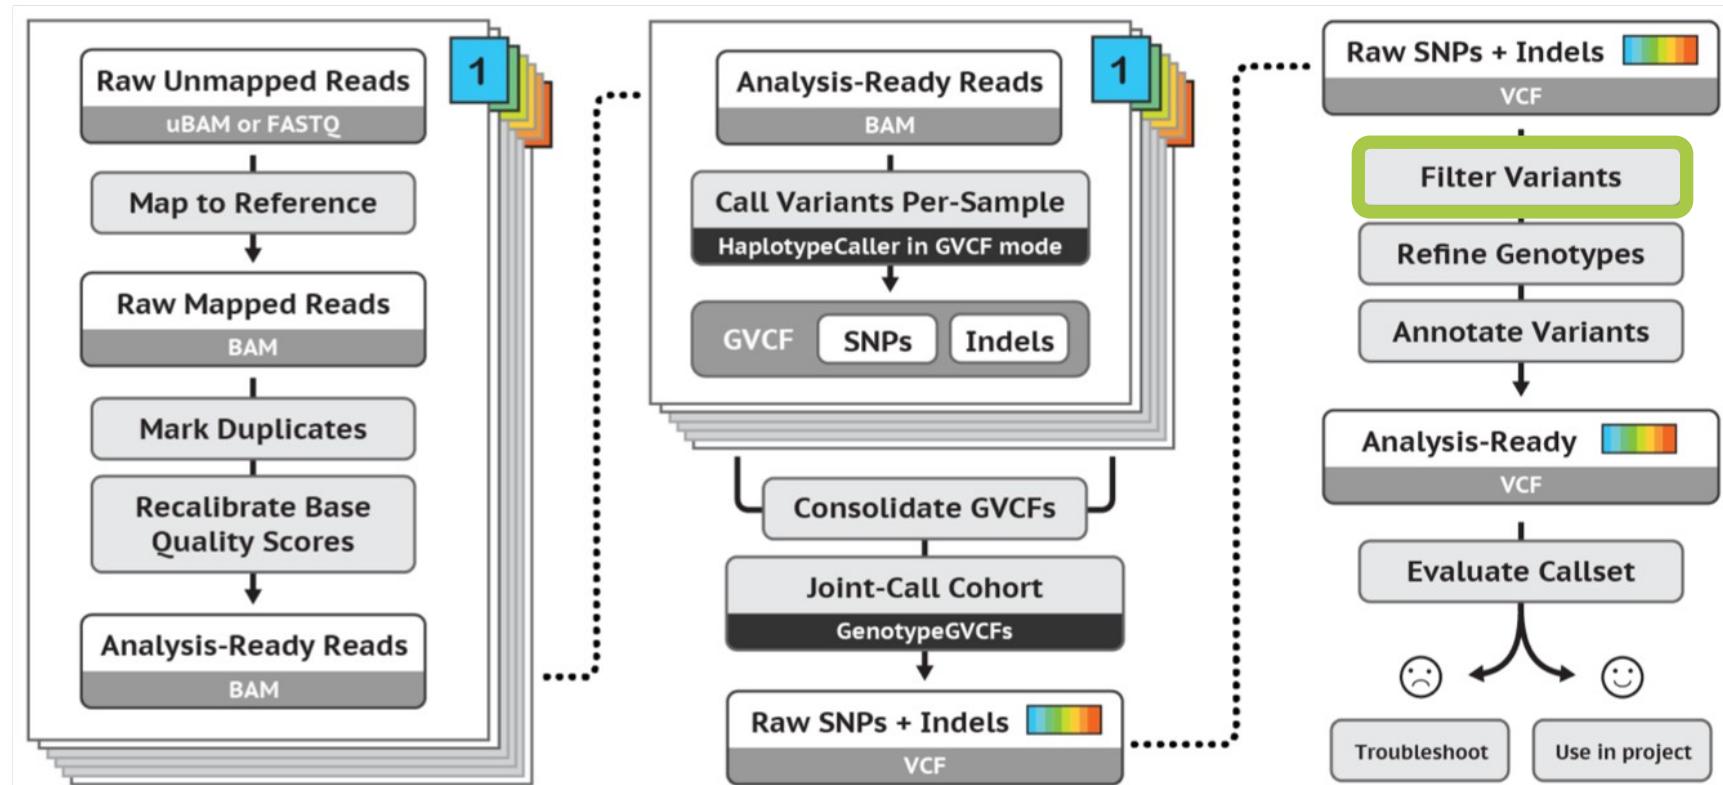

Base Quality Score Recalibration (BQSR)

1. During base calling, the sequencer estimates a quality score for each base. This is the quality scores present in the fastq files.
2. Systematic (non-random) errors in the base quality score estimation can occur.
 - due to the physics or chemistry of the sequencing reaction
 - manufacturing flaws in the equipment
 - etc
3. Can cause bias in variant calling
4. **Base Qualtiy Score Recalibration** helps to calibrate the scores so that they correspond to the real per-base sequencing error rate (phred scores)

```

Filtering

Variant quality score recalibration (VQSR):

For large data sets (>1 WGS or >30WES samples)

GATK has a machine learning algorithm that can be trained to recognise "likely false" variants

We do recommend to use VQSR when possible!

Hard filters:

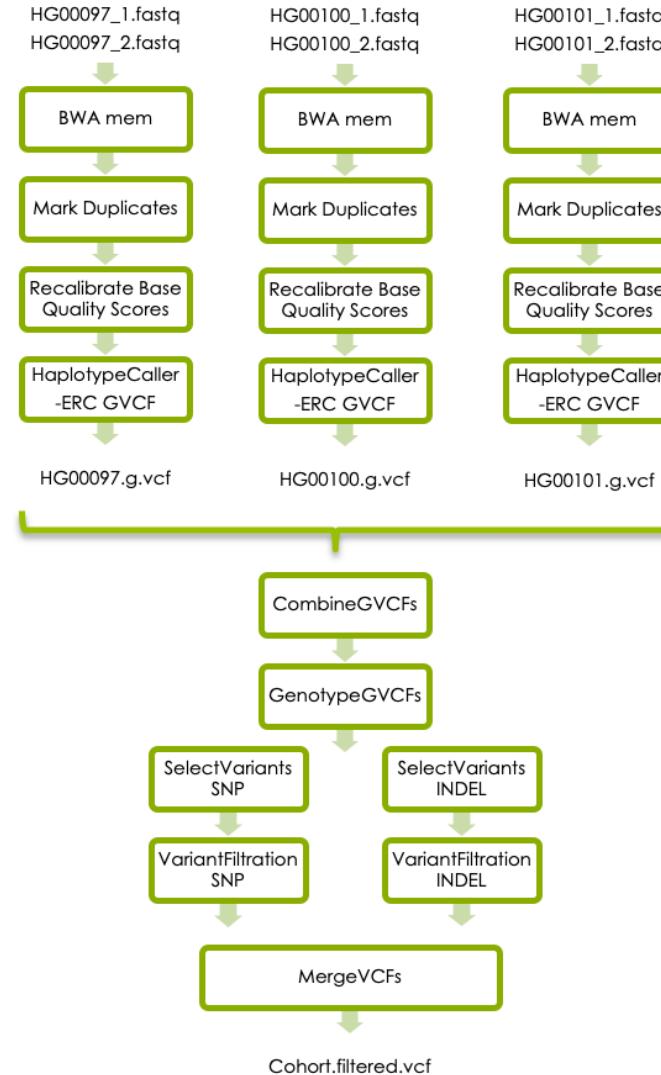

For smaller data sets

Hard filters on information in the VCF file

For example: Flag variants with "Q < 40.0"
